

E ANALYTICS STUDIO

From Data to Decision

Why more data does not create better decisions — and how organisations move from scattered information to confident, trackable action.

A COMPANY THESIS

eanalyticsstudio.com

FOR FOUNDER-LED, PEOPLE-POWERED BUSINESSES

You Already Have the Data. Now Make It Work for You.

Stop guessing what is working inside your business.

You already have data — in bookings, CRM, spreadsheets, surveys, staff updates, website analytics, and half a dozen default dashboards. The question was never whether you have it. It is whether it is organised, trusted, understood, and connected to the decisions you need to make.

You have more data than ever, but less clarity than you need.

James

CUSTOMER-SERVICE-LED BUSINESS

Bookings, calls, staff, complaints, customer journeys — and software that only ever tells part of the story.

“What is wasting staff time?”

“Where are customers dropping off?”

“How do I stop relying on gut feel?”

Emma

WELLBEING / PERFORMANCE BUSINESS

Clients, programmes, surveys, and a strong mission — but weak evidence of the impact it is actually having.

“Is the service actually improving outcomes?”

“How do we prove impact to clients or funders?”

“How do we turn feedback into decisions?”

As your business grows, instinct is no longer enough — but your data is not yet clear enough to replace it.

This document sets out our thesis: why growing, people-powered businesses end up with more data and less clarity, and what has to change — starting with a focus on impact, not activity — before another dashboard gets built.

SECTION 1

The Thesis

Most organisations are not short of data. They are short of understanding — and short of proof that what they do is actually working.

People-powered businesses need better ways to understand performance, behaviour, and impact. That is the gap we exist to close.

WHO IT'S FOR	Founder-led, private-sector service businesses — built around bookings, client journeys, staff performance, wellbeing, health, training, coaching, or operational delivery — that have outgrown instinct, spreadsheets, and default dashboards.
TRIGGER MOMENT	The business has become too complex to manage by instinct alone. The founder needs to know what is working, what is wasting time or money, whether the service is creating impact, and what decision to make next.
OUR PROMISE	We turn scattered data into clear metrics, practical dashboards, and decision-ready insight — so leaders can stop guessing and prove the impact of what they've built.

CORE BELIEF

Data is only valuable when it changes behaviour, improves a decision, or proves the impact you're having. Everything else is storage.

We are a behavioural data company, not a data consultancy, an analytics agency, or a dashboard vendor. Those businesses are built to process information. We are built to change what an organisation does next — and to help leaders prove the impact of what they've already built.

Our sharpest difference is not technical depth. It's this:

I understand the human behaviour behind the data — and I can translate complex information into decisions non-technical leaders can actually use.

We combine four disciplines that are rarely put in the same room: behavioural science and psychology, to explain why people, staff, and customers act the way the data shows; data analytics, to establish what is actually happening; research methods, to design measures that hold up under scrutiny; and technology, to make the resulting system repeatable.

The output is a decision system, evolving from consultancy into software supported by behavioural expertise, automation, and AI — not a one-off report that ages badly.

SECTION 2

Why Data Starts to Work Against You

Data starts to work against you when it grows faster than your ability to organise, understand, and act on it.

This is not a dramatic claim. It is a practical, observable pattern. It shows up as:

- Different teams using different sources of truth for the same question.
- Leaders who cannot say, with confidence, which numbers are reliable.
- Dashboards that show activity, but not the decision the activity should inform.
- Reports that are produced on schedule and read by almost no one.
- Customer, sales, marketing, and operational data that never meet in the same view.
- Teams collecting more information without a clear view of what is actually missing.
- Decisions delayed because nobody can agree on what to trust.
- New tools purchased before the underlying problem was understood.
- Performance measured in numbers that describe outcomes but never explain behaviour or prove impact.

None of this is a failure of effort. It is what happens by default as an organisation grows, adds people, adds tools, and keeps collecting. Left alone, it does not resolve itself. It compounds.

SECTION 3

How E Analytics Studio Is Different From a Typical Data Consultancy

A dashboard can show what happened. It does not automatically tell you what matters, why it happened, or what to do next.

Typical data consultancy	E Analytics Studio
Starts with tools	Starts with decisions
Builds dashboards	Reviews what data already exists
Cleans data in isolation	Identifies what can be trusted
Focuses on reporting outputs	Explains what is missing
Asks “what do you want to see?”	Connects data to behaviour, performance and decision-making
Delivers visibility	Designs better measures where needed
Leaves interpretation to the client	Builds dashboards only when they support decisions
	Helps leaders understand what to do next

We position this work as behavioural data strategy, decision support, measurement design, data interpretation, and systems for action — not as a generic dashboard build, a reporting agency, or an outsourced analyst function.

SECTION 4

The Fragmentation and Saturation Curve

This is the process we see inside almost every organisation we work with, regardless of size or sector. It is not a criticism — it is what happens by default when data collection outpaces the systems built to make sense of it.

1

Collection

The business starts collecting data because it needs to run: customers, sales, website visits, enquiries, projects, performance, finance, staff, operations.

2

Tool Expansion

Different functions add their own tools — a CRM for sales, analytics for the website, spreadsheets for operations, survey tools for feedback, finance software for revenue, marketing platforms for campaigns, dashboards for reporting, project tools for delivery.

3

Fragmentation

The data now lives in different places. Different people own different files. Different teams define success differently. The same customer, project, or performance question may have several answers.

4

Saturation

The organisation reaches a point where more data no longer creates more clarity. There are too many sources, too many reports, too many numbers — and not enough agreement on what matters.

5

Decision Drag

Decisions become slower, more reactive, or based on partial evidence. The business feels informed but still does not know what to do next.

6

E Analytics Intervention

We organise what data exists, assess quality and trust, identify what is missing, educate leaders and teams, connect data to decisions, and build systems only where useful.

7

Decision System

The organisation moves from scattered data to clearer measurement, better interpretation, and decisions that can be tracked over time.

SECTION 5 · ANONYMISED EXAMPLE

From Scattered Data to Clearer Decision-Making

Details below are anonymised and generalised to protect client confidentiality. No names, sectors, or identifying details are included.

SITUATION

An e-commerce founder had every default tool switched on: the platform's built-in sales dashboard, Google Analytics, an email platform's campaign reports, and a spreadsheet stitched together before every board meeting. On paper, the business looked fully instrumented.

PROBLEM

None of it explained impact. The founder could see traffic, orders, and revenue — but not which channels, campaigns, or customer segments were actually driving profitable growth, and which were quietly costing money. Every default dashboard told its own story, and none of them agreed with each other.

WHAT WE DID

We audited the existing tools and their default reports, identified which numbers could be trusted and which were double-counting or contradicting one another, and worked with the founder to define the handful of decisions the data actually needed to support — where to spend the next pound of marketing budget, which products to back, and which customers to retain.

WHAT CHANGED

The stack of default dashboards was replaced with a small number of decision-focused metrics tied to profit and retention, not just traffic. Marketing spend was reallocated within a month based on what the data actually showed, and reporting before board meetings dropped from days to hours.

WHAT THIS SHOWS

The constraint was never a lack of data or tools. It was not knowing which numbers actually reflected impact, and which were just activity dressed up as insight — the exact pattern this thesis is built to address.

SECTION 6

The Model: Organise, Understand, Act

This is the core of how we work. Not three products sold separately, but three stages of the same process — each building the foundation for the next.

STAGE 1 — ORGANISE

Create a clear picture of what data the organisation already has.

Who this is for

- Founders who know data exists but cannot see the full picture
- Operations leaders managing too many spreadsheets or reports
- Marketing leaders with disconnected campaign, website and customer data
- Sales leaders with CRM data that is incomplete or underused
- Programme leads who need clearer reporting
- Senior leaders who want confidence before investing in tools or dashboards

What is involved

- Map current data sources and identify where data is stored
- Review ownership and access
- Assess completeness and consistency
- Identify duplicated or conflicting records
- Assess whether data can be trusted
- Identify missing data needed for decisions
- Create a practical data map and priority list

Client output

Data Source Map · Data Quality & Gap Review · Decision Readiness Summary · Recommended Next Steps

Plain-English outcome: *You know what data you have, where it lives, what can be trusted, and what needs fixing first.*

STAGE 2 — UNDERSTAND

Turn organised data into meaning.

Who this is for

- Leaders who have reports but do not know what they mean
- Founders trying to understand customers, sales, or performance
- Marketing teams trying to understand audience behaviour and campaign results
- Operations leaders trying to identify friction or inefficiency
- Programme or service leads trying to understand outcomes and impact
- Teams preparing to make strategic decisions based on incomplete information

What is involved

- Interpret data through behavioural science and decision-making principles
- Identify patterns, risks, and blind spots
- Connect metrics to customer, team, or organisational behaviour
- Clarify what current data can and cannot explain
- Design better measures where existing data is weak
- Create hypotheses for what to test next
- Translate findings into practical recommendations

Client output

Behavioural & Data Insight Report · Key Findings & Decision Implications · Metrics & Measurement Recommendations · Priority Questions to Test

Plain-English outcome: *You understand what your data means, what it does not explain yet, and which decisions it should support.*

STAGE 3 — ACT

Build the system that helps the organisation make and track better decisions.

Who this is for

- Leadership teams that need ongoing visibility
- Managers tracking performance, change, or interventions
- Marketing or growth teams testing website, campaign, or customer changes
- Organisations that need to report impact over time
- Founders who need a clearer decision system, not just another report
- Teams preparing for scale, funding, client reporting, or operational improvement

What is involved

- Design dashboards or reports around decisions, not vanity metrics
- Create repeated measurement structures
- Build tracking systems for performance, behaviour, impact, or change
- Connect data sources where useful
- Create interpretation notes or insight panels
- Support implementation, review and iteration
- Educate teams on how to use the system

Client output

Decision Dashboard / Reporting System · Measurement Framework · Review Rhythm · Action Tracker · Ongoing Improvement Recommendations

Plain-English outcome: *You have a system that helps you see what is changing, decide what to improve, and track whether action worked.*

SECTION 7

Start With Your Current Data Position

Before the first session, complete the short diagnostic on the following page or take the Data Use & Performance Survey on the E Analytics Studio website.

The goal is not to judge your data maturity. The goal is to understand where your data currently lives, how it is being used, and where better structure or interpretation could improve decisions.

Primary next step

Complete the diagnostic form on the next page and send it back before your first session.

Or take the Data Use & Performance Survey at eanalyticsstudio.com/survey.html

SECTION 8

Client Diagnostic Form

Please complete before your first session and return to karol@eanalyticsstudio.com, or complete the online version at eanalyticsstudio.com/survey.html.

Organisation name:

Contact name:

Role:

Email:

Website:

1. What types of data does your organisation currently collect?

- ☐ CRM / customer records
- ☐ Website analytics
- ☐ Sales data
- ☐ Marketing data
- ☐ Survey data
- ☐ Operational data
- ☐ Finance data
- ☐ Team / staff data
- ☐ Performance reports
- ☐ Spreadsheets
- ☐ Dashboards
- ☐ Other

2. Where is this data currently stored?

3. Who currently owns or uses this data?

4. What decisions do you want your data to support?

5. What feels unclear, unreliable, or missing?

6. Do you currently have dashboards or reports?

- ☐ Yes, and they are useful
- ☐ Yes, but they are not used well
- ☐ Yes, but we do not fully trust them
- ☐ No
- ☐ Not sure

7. What would better use of data help you improve?

- ☐ Winning clients
- ☐ Sales
- ☐ Marketing
- ☐ Customer understanding
- ☐ Website performance
- ☐ Team performance
- ☐ Operational decisions
- ☐ Reporting
- ☐ Impact measurement
- ☐ Strategy
- ☐ Other

8. What would make this project successful?**9. Is there anything else we should know before the first session?**

Send this completed form to karol@eanalyticstudio.com or complete the online survey at eanalyticstudio.com/survey.html.
